

► 4/115 The design of a hoisting mechanism for the dump truck is shown in the enlarged view. Determine the compression P in the hydraulic cylinder BE and the magnitude of the force supported by the pin at A for the particular position shown, where BA is perpendicular to OAE and link DC is perpendicular to AC . The dump and its load together weigh 20,000 lb with center of mass at G . All dimensions for the indicated geometry are given on the figure.

$$\text{Ans. } P = 26,900 \text{ lb, } A = 14,600 \text{ lb}$$

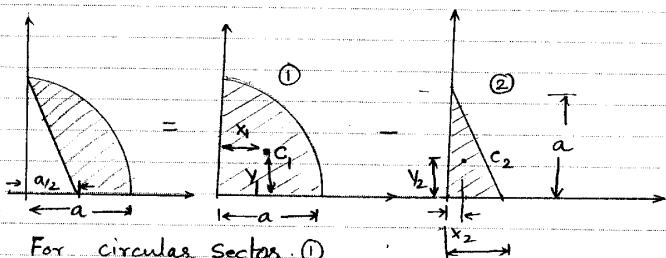

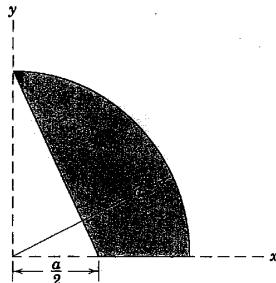

Problem 4/115

- Note 1. Pin at point B connects "hydraulic cylinder and triangular plate, not the truck box".
2. member DC and the hydraulic cylinder BE are two force members so the direction of force in these members will be along them.

- 5/51 By the method of this article, determine the x - and y -coordinates of the centroid of the shaded area of Prob. 5/19, repeated here.

$$\text{Ans. } \bar{X} = \frac{7a}{6(\pi - 1)}, \bar{Y} = \frac{a}{\pi - 1}$$

For circular Sector ①

$$\text{Area: } A_1 = \frac{1}{2}(\pi r^2) \quad \text{Centroid } x_1 = \frac{4a}{3\pi} = y_1$$

For Triangle ②

$$\text{Area: } A_2 = -\frac{a^2}{4} \quad \text{Centroid } x_2 = \frac{1}{3}(a) = \frac{a}{3}$$

$$y_2 = \frac{1}{3}a = \frac{a}{3}$$

For the Given Section

$$x = \frac{\sum A x}{\sum A} = \frac{\frac{\pi a^2}{4} * \frac{4a}{3\pi} - \frac{a^2}{4} * \frac{a}{3}}{\frac{\pi a^2}{4} - \frac{a^2}{4}}$$

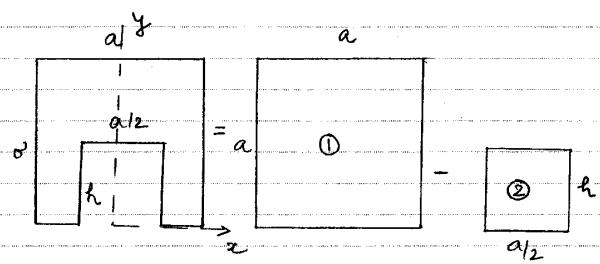

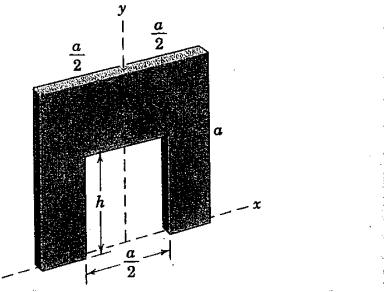

$$\Rightarrow x = \frac{7a}{6(\pi-1)}$$

$$y = \frac{\sum A y}{\sum A} = \frac{\frac{\pi a^2}{4} * \frac{4a}{3\pi} - \frac{a^2}{4} * \frac{a}{3}}{\frac{\pi a^2}{4} - \frac{a^2}{4}}$$

$$y = \frac{a}{\pi-1}$$

- 5/67 Determine the dimension h of the rectangular opening in the square plate which will result in the mass center of the remaining plate being as close to the upper edge as possible.

$$\text{Ans. } h = 0.586a$$

For Plate ①

$$\text{Area: } A_1 = a^2, \text{ centroid } x_1 = 0, y_1 = a/2$$

For Plate ②

$$\text{Area: } A_2 = -\frac{ah}{2}, \text{ centroid } x_2 = 0, y_2 = h/2$$

For Given plane

$$x = 0 \quad \text{and} \quad y = \frac{a^2 \cdot \frac{a}{2} - ah \cdot \frac{h}{2}}{(a^2 - ah)} = \frac{1}{2} \left(\frac{a^2 - h^2}{a - h} \right)$$

we want to maximize y so

$$\frac{dy}{dh} = 0 \Rightarrow \frac{1}{2} \frac{(a-h)(-h) - (a^2 - h^2)(-\frac{1}{2})}{(a-h)^2} = 0$$

$$\Rightarrow h/4 - ah + a^2/2 = 0$$

$$\Rightarrow h = a(2 \pm \sqrt{2})$$

h has to be less than a so we discard + sign.

$$\Rightarrow h = a(2 - \sqrt{2}) = 0.586a$$
